

Redwood

TECHNICAL DATA SHEET

Redwood Forests Certified for Sustainable Harvests

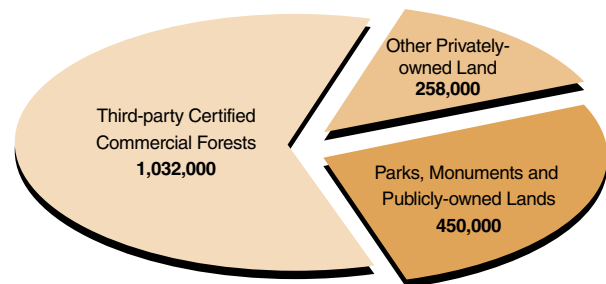

80% of redwood forestlands certified...

Four of every five acres of commercial redwood forest are now independently certified as well managed and harvested on a sustainable basis. The major redwood lumber mills and landowners have completed independent third-party certification of their redwood forestlands. As a result, over 1 million acres, approximately 80 percent of the available redwood commercial forest are certified under one of the two most widely recognized certification programs: Forest Stewardship Council (FSC) or the Sustainable Forestry Initiative (SFISM) program.

26% of redwood lands preserved...

There are 1.74 million acres¹ of Coastal Redwood (*Sequoia sempervirens*) forests on California's north coast. About 26 percent, or 450,000 acres of these forests are preserved in national, state and municipal parks, national monuments and other administratively withdrawn lands² where harvesting is prohibited.

Total Redwood Forests
(1.74 million acres)

Of the remaining 1.29 million acres where harvesting can take place, approximately 1.03 million acres³ (80 percent) are currently being well managed according to independent third-party certification programs.

Commercial Redwood Forests
(Total 1.29 million acres)

Consumers receive assurance of environmentally sound harvesting practices...

Forest certification provides consumers with assurance that the redwood products they purchase have been harvested in an environmentally sound manner. The basic tenants of certification programs include:

- sustainable forestry
- prompt reforestation
- protection of water quality
- enhancement of wildlife habitat
- minimizing the visual impact of harvesting
- protection of unique sites
- improvements in wood utilization

These voluntary third-party certification programs are in addition to the mandatory requirements of California's Forest Practices Act, recognized as the most thorough timber harvesting regulation in North America. Section 913 of the Forest Practices Act requires that any company owning commercial forests greater than 50,000 acres prepare a Sustained Yield Plan. These plans must project an equal balance of growth and harvest over a 100 year period while ensuring sustainability of all forest resources, including wildlife, watershed and soil.
